            <div class="about-col-1">
                <h2>Parameter Assessment for child rescue from
borewell</h2><br>
                <p>
                    The project “Parameter Assessment for Child Rescue
from Borewell” focuses
                    on the development of a system by employing a range of
sensors and Arduino-based
                    control mechanisms.The Arduino Uno microcontroller
serves as the central processing unit,
                    coordinating the actions of various sensors such as
the ultrasonic sensor for measuring distance,
                    PIR sensor for detecting motion, DHT11 sensor for
monitoring temperature and humidity,
                    and MQ135 sensor for detecting toxic gases. The data
collected from these sensors is
                    displayed on an LCD unit for realtime monitoring. The
NRF24L01 module enables wireless
                    communication between the rescue system and a remote
monitoring unit. Through the
                    integration of these components, the project aims to
enhance the efficiency and effectiveness
                    of child rescue operations in borewell incidents.The
system is comprised of two main components:
                    a stationary Arduino Uno part and a mobile Arduino Uno
part. The stationary part functions as a
                    receiver, while the mobile part serves as a
transmitter. The transmitter Arduino is inserted
                    into the borewell and utilizes an L298N motor driver
and a 10 rpm DC motor to descend down the borewell.
                    An ultrasonic sensor HCSR04 detects obstacles, causing
the transmitter to halt at a distance of 25 cm
